

Please build out a demo of a React component working in create react app <https://github.com/facebook/create-react-app>.

If you have another way that is easier to demo your work, then that is also fine. **The component to build is a `List` component and it is attached below (sketch and image).** Things we will be looking for on the code side:

- A clean approach to styles (using styled-components)
- Correct usage of react 16 with hooks.
- Load the list data from mockable API or local JSON.
- Good approach State management (using redux)
- Bonus points for `Load More` list items on scrolling to the bottom of the list.

Things we will be looking for on the UI side:

Attention to detail that UI implementation matches design correctly.
